Projects I've Built

Purple AI Sandbox – Secure runtime for untrusted AI agents in Rust. Multi-layer isolation using eBPF packet filtering, seccomp-BPF syscall validation, Linux namespaces, and cgroups v2 resource limits. Ships with pre-built security profiles, async REST API (Tokio/Axum), token auth, and structured JSON audit logging. Built this because I wanted AI agents that can execute code without compromising the host.

breveTest – Declarative API testing framework in Java. Define REST tests in `.breve` config files, zero test code required. Auto-discovers tests during Maven builds, supports all HTTP verbs, integrates into CI/CD pipelines.

Open Source Contributions (Shipped to Production)

- **Cilium:** Fixed Gateway API reconciler crash (PR #38874), routing misconfiguration fix (PR #39275), egressDeny docs backported to v1.16–v1.18 (PR #40272)
- **CoreDNS:** RFC 6763 SRV record fix (PR #7402), RFC 1035 TXT comparison fix merged into v1.12.3 (PR #7413), flaky test elimination (PR #7438), plugin test framework refactor (PR #7798)
- **Sourcemeta Core:** Replaced hash map vocabulary lookups with bitset-based O(1) approach for 29 JSON Schema vocabularies – 497 additions, 129 deletions across 19 files (PR #2040)
- **Kagent:** Fixed agent deletion bug causing orphaned records (PR #1178)

Stack: Go, Rust, C++, TypeScript, Python — Kubernetes, eBPF, Cilium, CoreDNS — Linux internals, performance optimization

Sincerely,

Azeez Alishah Hussain Syed
